Example for regstats

This example demonstrates the use of package
`regstats`, v1.1a as of 2023-04-04.
The used options were `left=true,timer=true`.
`left=false,timer=false` would be the defaults.

Regarding the use of ε-TeX, the `morewrite` package, the reservation of `inserts`, and using more `math families` please see the documentation!

For the resulting message, please compile `regstats-example.tex` and have a look at the end of its `.log`-file.

Because the compilation time for this example is usually quite short, option `timer` is not demonstrated very spectacular.

To test a register type for the number of available registers, uncomment the respective line below and set the number to an interesting value.
